A1: Computer or Not

Decide if each of these things are a computer or not.

When you are making the decision: Think of IPOMS.

- Does it have a way of inputting user commands or instructions?
- Does it have a processor or way of making decisions?
- Does it have output? Does it show the user the results of their choices?
- Does it have memory or a way of remembering instructions?
- Can it be turned on and off?
- Does it have a circuit board or electronics?
