

# Void Methods

The basics....

By **Dr. Seuss**

**One fish**

**two fish**

**red fish**

**blue fish**

Suppose that  
you wanted  
to remake  
this book  
cover.

But I don't  
want to do  
that. It seems  
pointless.

Can't you  
just play  
along? It's  
Dr. Seuss.

## Method

- aka: a subprogram, a function, a procedure.
- A set of code which is separate from the rest of the program.
- It has a name and can be called (invoked) at any point in a program simply by using the method's name.
- It can receive information when called (or not) and return a value (or not).
- It has a method signature (The first line: `public void name ()`) which defines the major functions of the method.
- It's code is enclosed in { }.

## When are they used in the PDLC?

- In the design phase, the code is divided into methods. Method signatures are also written then.
- In the code phase, each method is assigned to a programmer.
- Methods allow hundreds of programmers to work together easily. They break a big program into little pieces which can call each other.
